The primary advantage to POCT is the faster turnaround time for results. An additional advantage is that these tests often require less sample volume than tests performed in the laboratory. The use of POCT can increase efficiency of services and improve outcomes for patients. However, the variability of the testing environment and

conditions as well as the competency of staff performing the tests may have an impact on the quality and accuracy of POCT results. <http://abglamour.org/userfiles/78-ford-f250-manual-transmission.xml>

To ensure that POCT is performed safely and correctly, hospitals must have a clearly defined and wellstructured approach to POCT. Leadership may be involved in the planning process by identifying and approving the resources dedicated to the POCT program as well as the policies and procedures related to management and oversight of the program. Leadership may also wish to be involved by participating in the decisions regarding the selection of specific tests to be included in the POCT program. Typically, oversight and supervision are provided by the individual responsible for managing laboratory services, however leadership may wish to appoint a designee or allow the laboratory director to appoint a designee. Therefore, it is critical that staff performing POCT have the proper training and competency assessment to ensure test results are accurate and reliable. A staff training program includes the following Following initial training and competency, the standards require that staff performing POCT must be reassessed for competency at regular intervals to ensure the accuracy and reliability of results and the quality and safety of patient care. Manufacturers generally set guidelines for QC results for each device and staff performing POCT are required to perform QC as recommended. The person responsible for oversight of POCT is responsible for reviewing and evaluating the QC results and taking corrective actions when unacceptable QC results occur. Like other process in an organization, errors can happen at any phase of POCT. A study by Cantero, et. al. looked at the error rates during all phases of testing in the central laboratory and in performance of POCT. A higher rate of preanalytical errors was found to be associated with POCT compared to central laboratory testing. The most common error in preanalytic POCT occurred in relation to patient identification. Staff performing POCT failed to use two patient identifiers in 45% of the POC tests performed.

1 Organizations need to identify the risk points in the process where errors in POC testing may occur and take actions to mitigate those risks. Monitoring and evaluation of the POCT program is essential and must be included in the overall hospital quality improvement program. Please try again. Please try again. Your feedback helps us make Walmart shopping better for millions of customers. Sorry. We're having technical issues, but we'll be back in a flash. Done. Purchase clinical laboratory standards documents from our shop. View upcoming meetings. Our crosswalks take the guesswork out of understanding accreditation requirements. It contains the CLMA Domains, Competencies, and Levels within the competencies, as well as the CLSI documents and products that align with a specific level of competency or the entire competency. The ISO quality documents are listed along with the related CLSI documents under each QSE. CAP Accreditation Checklists are updated regularly to include CLSI's standards, guidelines, and other documents as references. Included in the database are over 100 CLSI consensus standards and guidelines. These standards focus on the results a laboratory should achieve, rather than specific methods to use. This crosswalk easily explains which CLSI documents give stepwise guidance to achieve those results.
